# Who Am I?

- Mohamed Zahran (aka Z)
- Computer architecture/OS/Compilers Interaction
- <http://www.mzahran.com>
- Office hours: Thursdays 5:00-7:00 pm
- Room: CIWW 328
- Course web page:  
<http://www.cs.nyu.edu/courses/fall10/G22.2130-001/>

# *Formal Goals of This Course*

- What exactly is this thing called compiler?
- How does the compiler interact with the hardware and programming languages?
- Different phases of a compiler
- Develop a simple compiler

# *Informal Goals of This Course*

- To get more than an A
- To learn compilers and enjoy it
- To use what you have learned in *MANY* different contexts

# Grading

- **The project (labs):** **60%**
  - Due several lectures later
  - Several parts
  - Mostly programming and dealing with tools
  - Can do on your own machine or NYU machines
  - Must be sure that they work on NYU machines
  - Getting help: office hours, mailing list, and FAQ
- **Final exam:** **40%**

# The Course Web Page

- Lecture slides
- Info about mailing list, labs, ... .
- FAQ
- Useful links (manuals, tools, book errata, ... ).
- Interesting links (geeky stuff!)

# The Book

- The classic definitive compiler technology text
- It is known as the **Dragon Book**
- A knight and a dragon in battle, a metaphor for conquering complexity
- We will cover mostly chapters 1 - 8

AND SUDDENLY YOU  
MISSTEP, STUMBLE,  
AND JOLT AWAKE?

Hello World !

```
main ( )  
{  
    printf ( " Hello World ! " ) ;  
}
```

0 Errors

1 Warning

( This is Definetly a Career Error, are You Sure  
You Want to Continue ? )

- What the Damned Compiler should have told me :@ -

# What Is A Compiler?

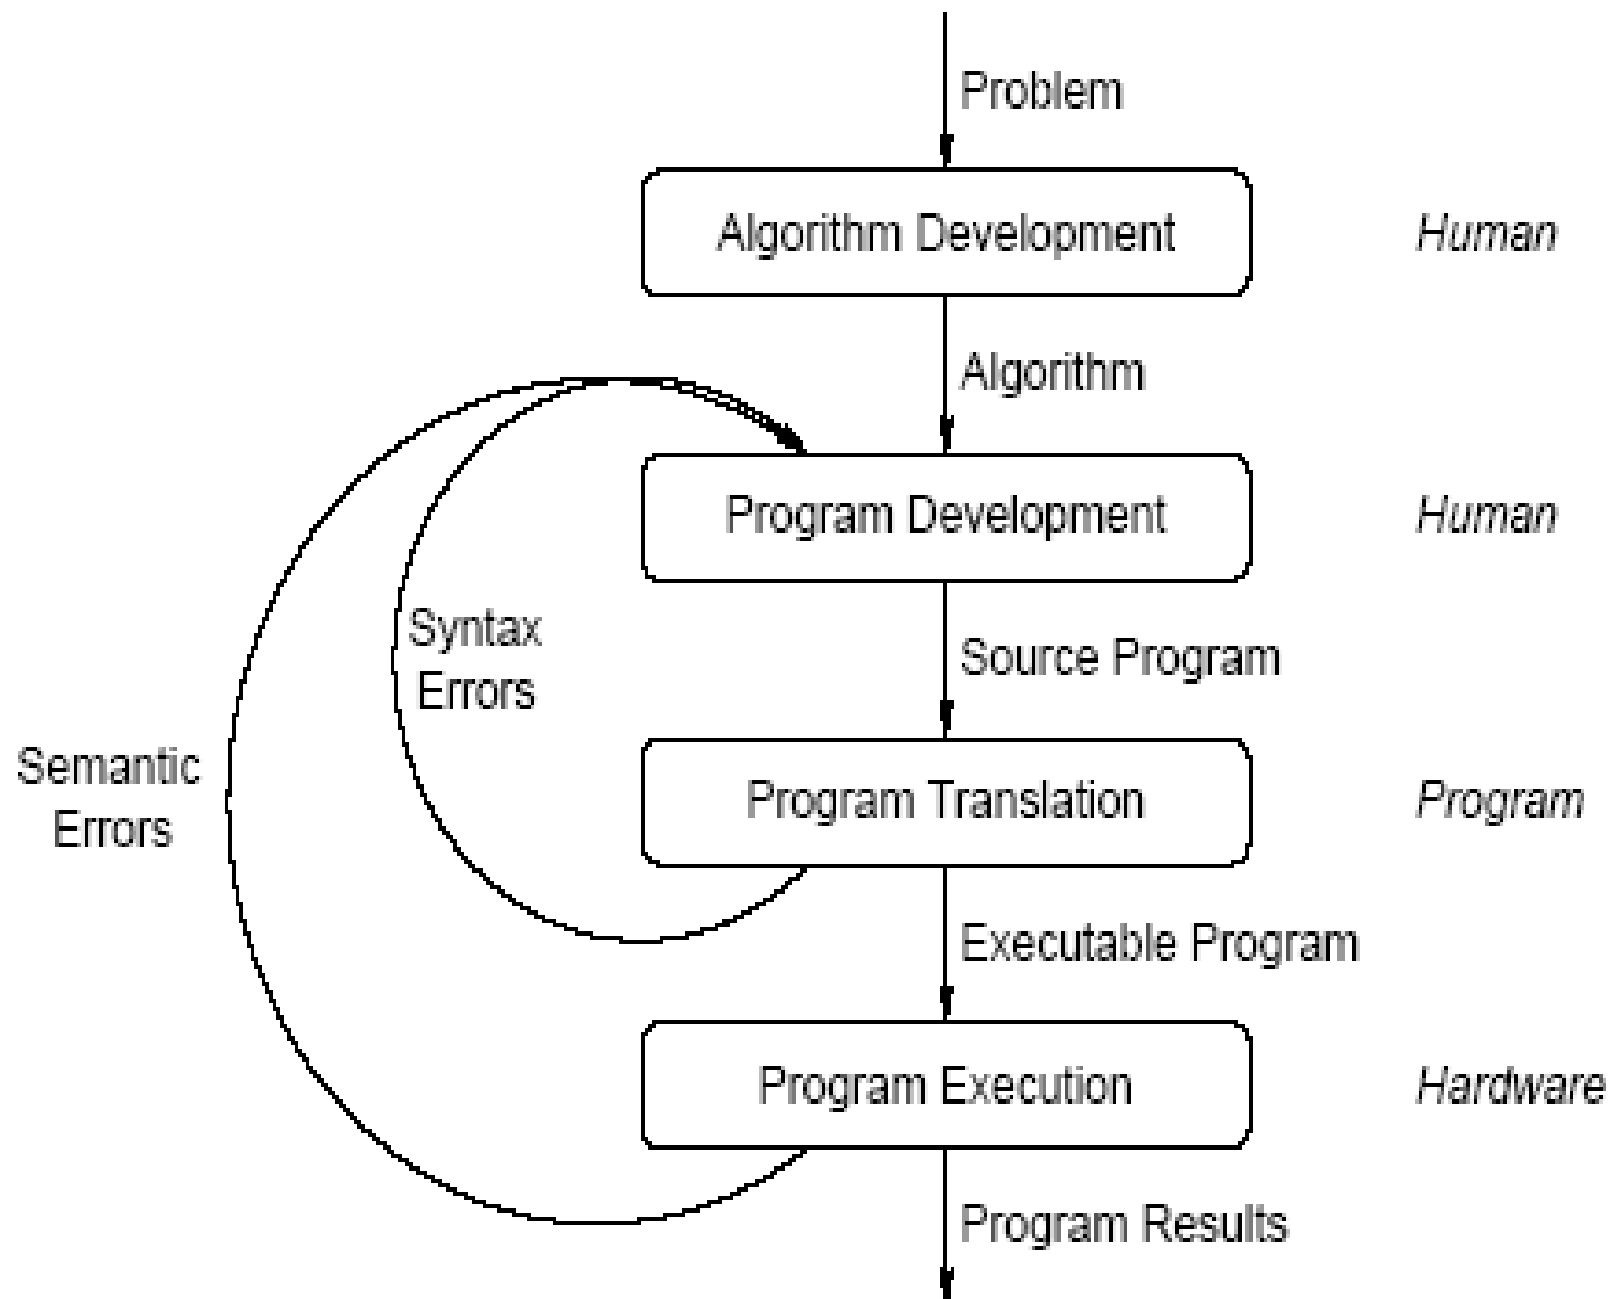

- Programming languages are **notations** for **describing computations** to **people** and to **machines**
- Machines do not understand programming languages
- So a software system is needed to do the translation
- This is the **compiler**

BEAR FACTS

by Burke

He always liked to open the Annual Programmer's Conference with a joke in binary.

Machine Architecture

Compiler writers  
must take advantage  
of new hardware features

Programming Languages

Compiler writers have to track  
new language features

Language Theory

Software Engineering

- Optimizing compilers are hard to build
- Excellent software engineering case study
- Theory meets practice

# Why Compilers Are So Important?

- Compiler writers have influence over all programs that their compilers compile
- Compiler study trains good developers
- We learn not only how to build compilers but the general methodology of solving complex and open-ended problems
- Compilation technology can be applied in many different areas
  - Binary translation
  - Hardware synthesis
  - DB query interpreters
  - Compiled simulation

source program

target program

input

Target Program

output

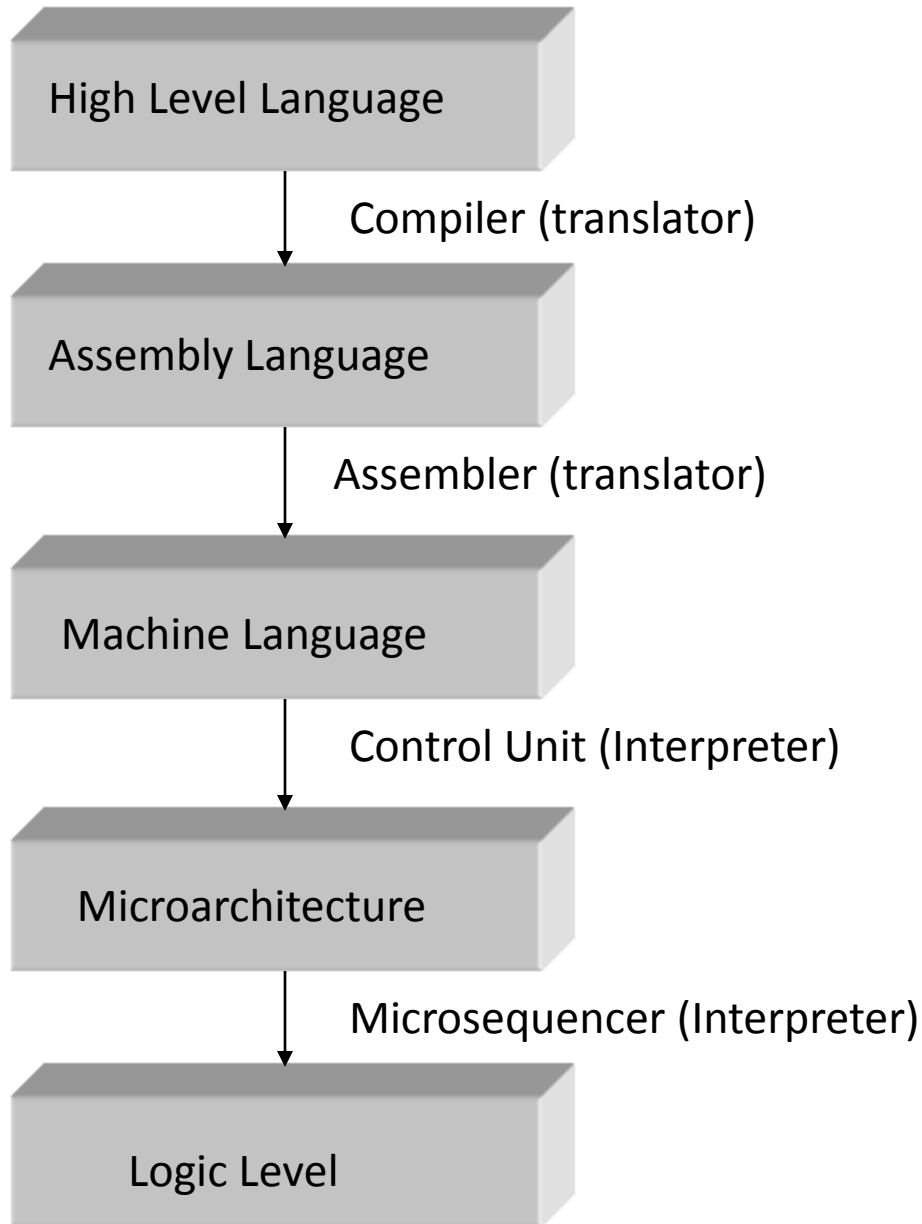

# So What Is An Interpreter?

- + Better error diagnostics than compiler
- Slower than machine language code directly executed on the machine

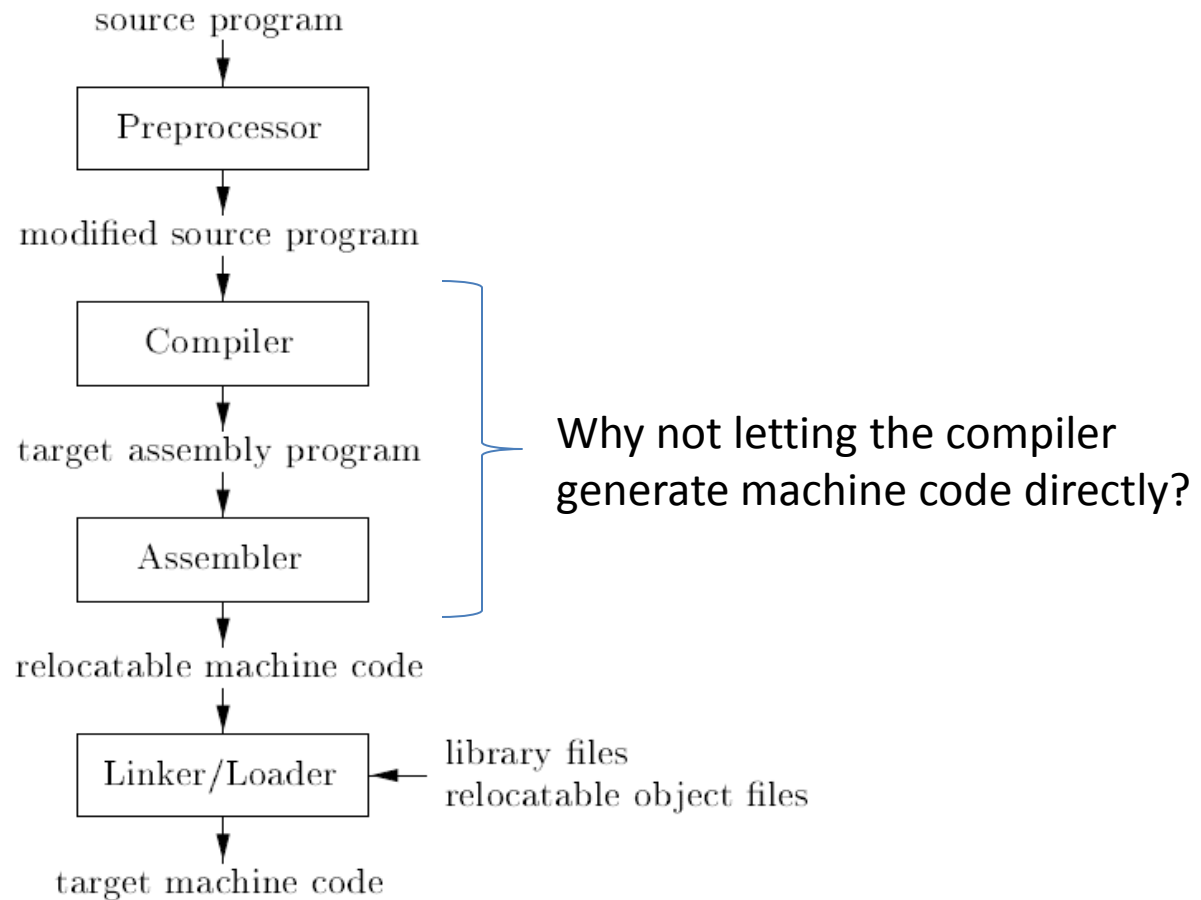

Problem → Algorithm Development → Programmer

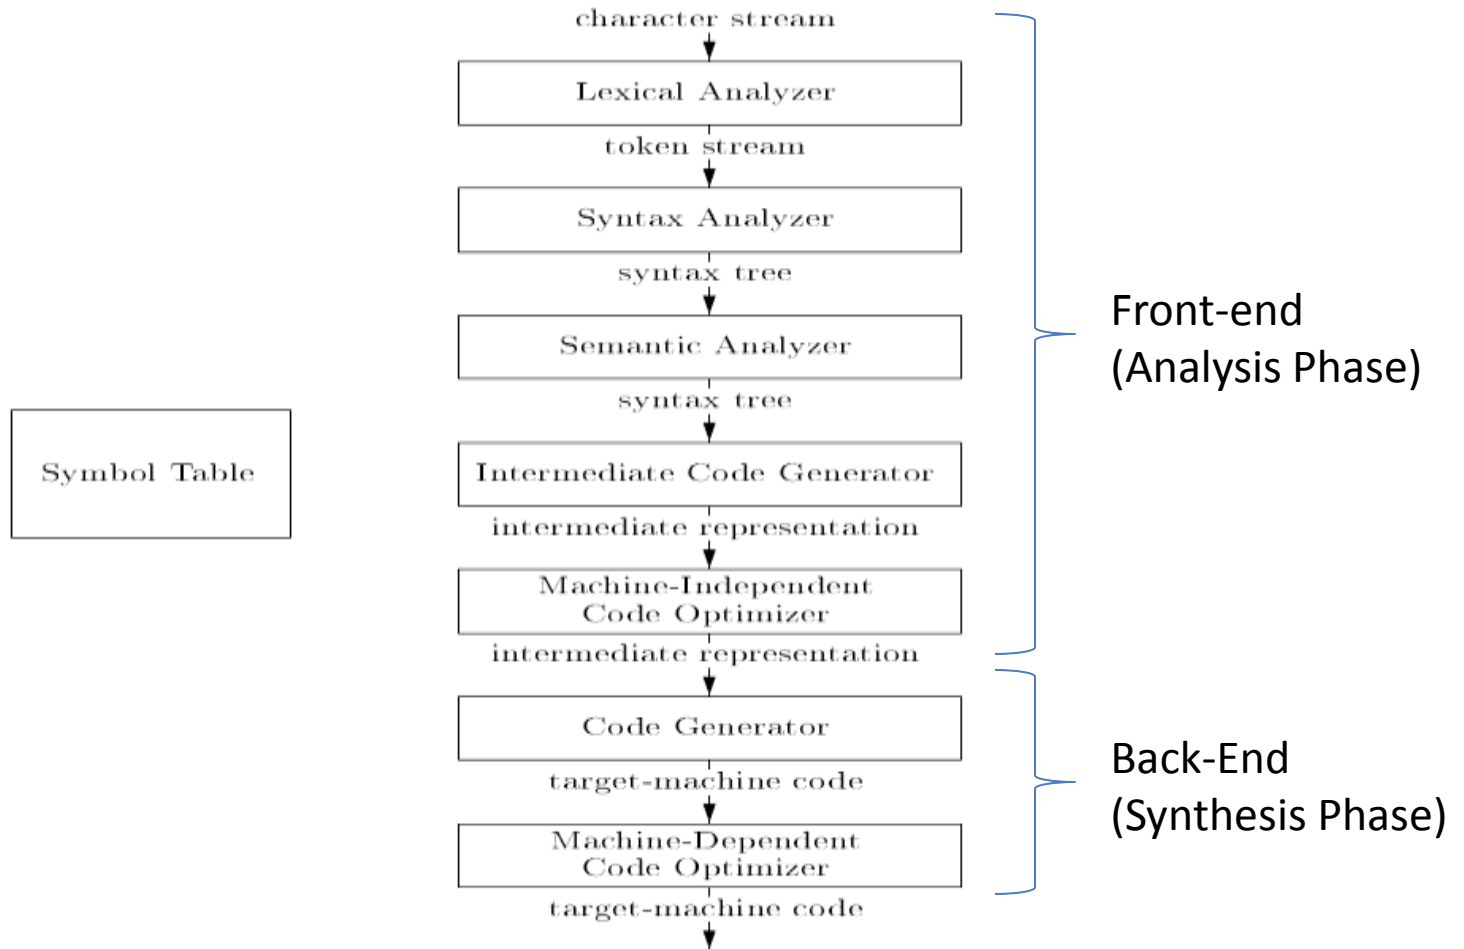

Device Level → Semiconductors → Quantum

# Compiler Is Not A One-Man-Show!

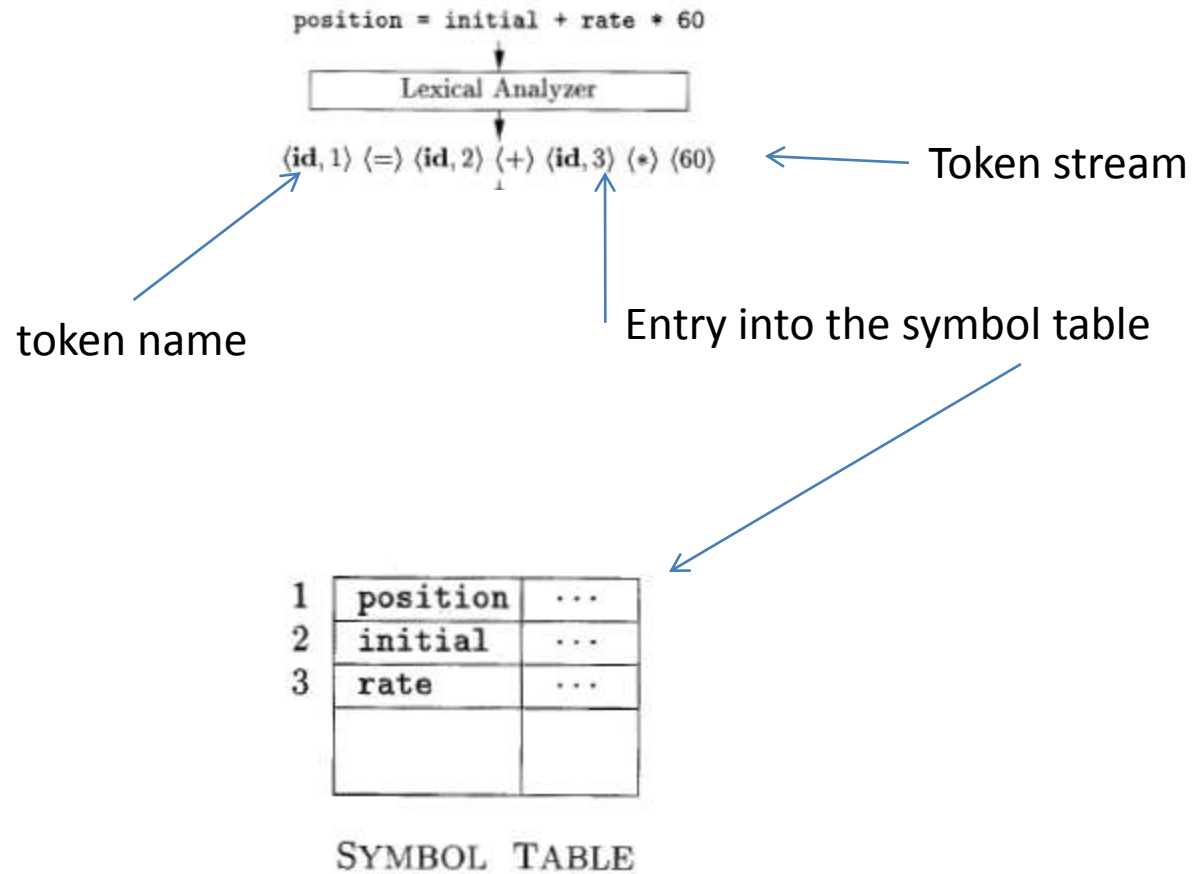

# Let's Have A Closer Look: Phases of A Compiler

# Lexical Analysis

- Reads stream of characters: your program
- Groups the characters into meaningful sequences: **lexemes**
- For each lexeme, it produces a **token**  
    <token-name, attribute value>
- Blanks are just separators and are discarded
- Filters comments
- Recognizes: keywords, identifier, numbers, ...

# Syntax Analysis (Parsing)

- Uses tokens to build a tree
- The tree shows the grammatical structure of the token stream
- A node is usually an operation
- Node's children are arguments

This is usually called a **syntax tree**

# Semantic Analysis

- Uses the syntax tree and symbol tables
- Gathers type information
- Checks for semantic consistency errors

# Intermediate Code Generation

- Code for an abstract machine
- Must have two properties
  - Easy to produce
  - Easy to translate to target language

```
t1 = inttofloat(60)
t2 = id3 * t1
t3 = id2 + t2
id1 = t3
```

- Called three address code
- One operation per instruction at most
- Compiler must generate temporary names to hold values

# Intermediate Code Optimization (Optional)

- Machine independent
- optimization so that better target code will result

```
t1 = inttofloat (60)
t2 = id3 * t1
t3 = id2 + t2
id1 = t3
```

```
t1 = id3 * 60.0
t2 = id2 + t1
id1 = t2
```

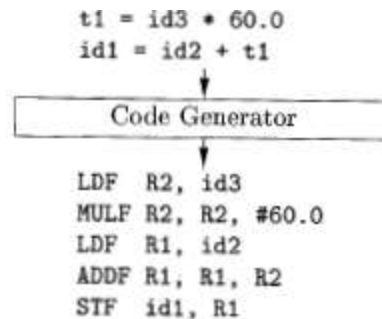

```
t1 = id3 * 60.0
id1 = id2 + t1
```

Instead of inttofloat  
we can use 60.0 directly

Do we really need t2?

# Code Generation

- Input: the intermediate representation
- Output: target language
- This is the backend, or synthesis phase
- Machine dependent

# Qualities of a Good Compiler

- **Correct:** the meaning of sentences must be preserved
- **Robust:** wrong input is the common case
  - compilers and interpreters can't just crash on wrong input
  - they need to diagnose all kinds of errors safely and reliably
- **Efficient:** resource usage should be minimal in two ways
  - the process of compilation or interpretation itself is efficient
  - the generated code is efficient when interpreted
- **Usable:** integrate with environment, accurate feedback
  - work well with other tools (editors, linkers, debuggers, . . . )
  - descriptive error messages, relating accurately to source

# Compilers Optimize Code For:

- Performance/Speed
- Code Size
- Power Consumption
- Fast/Efficient Compilation
- Security/Reliability
- Debugging

# Compiler Construction Tools

- Parser generators: automatically produce syntax analyzer
- Scanner generators: produce lexical analyzer
- Syntax-directed translation engines: collection of routines for walking a parse tree and generate intermediate code
- and many more ...

# A Little Bit of History

ENIAC

Eckert and Mauchly

- 1<sup>st</sup> working electronic computer (1946)
- 18,000 Vacuum tubes
- 1,800 instructions/sec
- 3,000 ft<sup>3</sup>

# A Little Bit of History

EDSAC 1 (1949)

<http://www.cl.cam.ac.uk/UoCCL/misc/EDSAC99/>

- Maurice Wilkes

1<sup>st</sup> stored program  
computer

650 instructions/sec

1,400 ft<sup>3</sup>

# A Little Bit of History

- 1954 IBM developed 704
- All programming done in assembly
- Software costs exceed hardware costs!

# A Little Bit of History

- Fortran I (project 1954-57)
- The main idea is to translate high level language to assembly
- Many thought this was impossible!
- In 1958 more than 50% of software in assembly!
- Development time halved!

John Backus  
(December 3, 1924 – March 17, 2007)

# A Glimpse At Programming Language Basics

- Static/Dynamic distinction
- Environments and states
  - Environment: mapping names to locations
  - States: mapping from locations to values

- Procedures vs Functions
- Scope

```
main() {  
    int a = 1;  $B_1$   
    int b = 1;  
    {  
        int b = 2;  $B_2$   
        {  
            int a = 3;  $B_3$   
            cout << a << b;  
        }  
        {  
            int b = 4;  $B_4$   
            cout << a << b;  
        }  
        cout << a << b;  
    }  
    cout << a << b;  
}
```

# Roadmap

- Today we have mostly discussed chap 1
- Chapter 2 gives an overview of the different phases of a compiler by building the front-end of a simple compiler
- Chapters 3-8 fill the gaps
